IFC Implementation Type

Toolbox/Server

IFC Data Import

WebSTEP is a generic STEP data browser, which is based on technology where the internal data model of the application is generated from the EXPRESS definition of the target product model. Due to this approach WebSTEP can create all the instances from the model in p21 file. It provides access to all the data in the model.

IFC Data Export (if relevant)

WebSTEP exports STEP p21 from the whole model or just part of it. WebSTEP provides also XML interface for accessing all the data in the model at one instance a time basis.
